

FILTRI ARIA SPORTIVI

L'importanza del filtro aria

La fase attiva di un motore a scoppio è la conseguenza della combustione all'interno di un cilindro di un carburante con un comburente, l'ossigeno contenuto nell'aria. Per tenere presente l'importanza della funzione del filtro, bisogna considerare che per la combustione di 1 Kg di benzina, equivalente a 1,35 litri, sono necessari 14,7 Kg di aria, cioè 12.245 litri (rapporto stechiometrico 14,7:1). L'aria, quindi è un elemento essenziale per la combustione, di conseguenza ad una maggior quantità d'aria corrisponde una migliore e completa combustione, il tutto per un rendimento superiore del motore. L'aria aspirata dal motore deve però essere pulita, altrimenti ogni corpo estraneo può comportare una rapida usura ed una perdita d'efficienza del propulsore. Ecco la necessità della filtrazione dell'aria, nonostante che, qualsiasi tipo di filtro rappresenti sempre, per se stesso, un ostacolo al flusso dell'aria.

Le funzioni del filtro aria

Le caratteristiche di un filtro aria in cotone, possono essere così riassunte: Permeabilità, Setacciamento, Ritenzione. Permeabilità, perché il filtro deve essere di minor ostacolo possibile per lasciar passare la maggior quantità d'aria. Setacciamento, per raccogliere tutto ciò che è estraneo all'aria. Ritenzione, per trattenere quindi tutte le particelle solide.

I filtri in cotone sono costituiti da un tessuto multistrato di cotone imbevuto d'olio, inserito fra due strutture reticolate d'alluminio.

Il materiale inquinante trasportato dall'aria, come polvere, gomma e detriti di ogni genere, tutto di carica negativa, nell'attraversare il tessuto è separato dall'aria e viene attratto dalle fibre impregnate d'olio, perché di carica positiva.

Il processo di filtraggio si compie ininterrottamente e, le particelle estranee, continuano a depositarsi sul tessuto senza ostruire il flusso d'aria.

I filtri in cotone, seppur più costosi, sono senz'altro quelli che offrono le migliori prestazioni: massima permeabilità, grande ritenzione e setacciamento.

La permeabilità dell'elemento filtrante è misurata dal "Pressure Drop" ossia la differenza di pressione a monte e a valle del filtro al variare della velocità del flusso d'aria.

Tale valore, misurato per i filtri in cotone, è sicuramente minore, a parità di condizione, di quello misurato per i filtri in carta e in spugna. I filtri in cotone, ancora, sono riutilizzabili più volte, previa pulizia con apposito detergente e rigenerati con l'apposito olio.

CDA - Carbon Dynamic Airbox

Il sistema filtrante CDA è costituito da un Airbox di forma cilindrica in vera fibra di carbonio che contiene un elemento filtrante lavabile e rigenerabile.

La scelta del materiale composito è dovuta al fatto che il carbonio ha una bassa conducibilità termica che permette di isolare dal calore del motore il filtro e l'aria aspirata. Sostituendo la scatola filtro originale con il CDA, l'aria fresca viene così convogliata direttamente nel filtro all'interno dell'airbox in carbonio e aspirata dal motore attraverso un deviatore di flusso con una perdita di carico minima (sistema brevettato, vedi disegno tecnico alla pagina seguente).

Il Kit CDA comprende anche un tubo flessibile per collegare il sistema ad una presa d'aria frontale. Il CDA nasce come sistema universale adattabile su qualsiasi tipo di vettura, le differenti applicazioni sono completate da un'ampia gamma di accessori che risultano necessari in fase di installazione.

Il CDA è disponibile in due dimensioni: il primo con diametro esterno di 130 mm è consigliato per motori fino a 1600 cc, il secondo con diametro esterno di 150 mm per cilindrata maggiori.

TEST AL BANCO DEL CDA SU AUDI TT 2.0TFSi (Golf V GTi, AUDI A3, SEAT Leon FR)

Modello AUDI TT STD

data: 03/03/2007 11:16
TEST RANGE Km/h: 60-250.5

MAHA LPS 2000 tipo veicolo: AUDI TT 2.0 TFSi
tipo motore: benzina

CDA - Kit specifici

Sono disponibili inoltre una vasta gamma di applicazioni speciali CDASP, ossia kit completi e pronti per il montaggio, studiati appositamente per un modello di auto.

Spesso il Kit speciale deriva da un CDA universale implementato da raccordi e riduttori sviluppati appositamente, mentre in altri casi il CDASP è composto da componenti uniche fatte su misura per la vettura con particolari flange e dimensioni personalizzate.

(vedi lista applicazioni da pag. 18 a pag. 25).

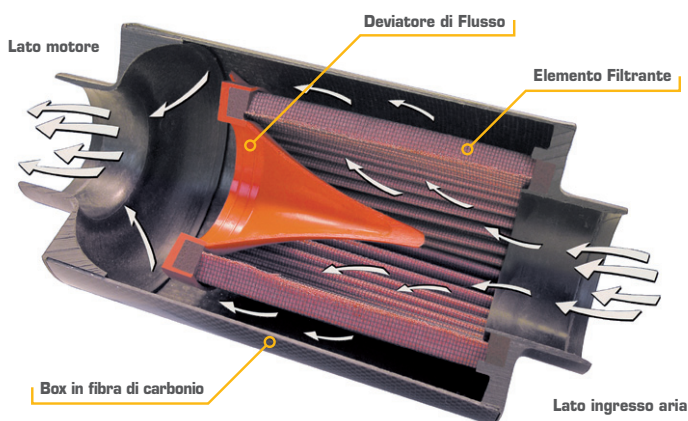

CDA – Tecnologia avanzata

Il sistema filtrante CDA è collegato ad una presa d'aria frontale tramite un tubo in alluminio flessibile.

Grazie alla presa d'aria dinamica, si ottiene un vero e proprio sistema di sovralimentazione che consente di convogliare aria fresca all'Airbox a velocità e portata nettamente superiori rispetto ai sistemi tradizionali. Il flusso d'aria entrante dalla presa dinamica viene ulteriormente accelerato grazie al deviatore di flusso conico all'interno dell'Airbox in fibra di carbonio.

Sovralimentazione dinamica, pressione più elevata e temperatura dell'aria più fresca, sono gli elementi che garantiscono un cospicuo aumento delle prestazioni del motore in termini di potenza e di coppia come dimostrano le prove al banco effettuate.

I Filtri Aria

I filtri aria BMC sostitutivi agli originali, sono filtri rigenerabili ad alto rendimento che consentono di migliorare la capacità del flusso d'aria aspirata rispetto ai tradizionali filtri in carta, con evidenti benefici nella qualità della combustione del motore.

I filtri aria BMC sono costituiti da un tessuto multistrato di cotone imbevuto d'olio a bassa viscosità, inserito fra due strutture reticolate di alluminio. Le reti in alluminio sono trattate con resina epossidica in modo da proteggerle dall'ossidazione causata dai vapori del carburante e dall'umidità presente nell'aria.

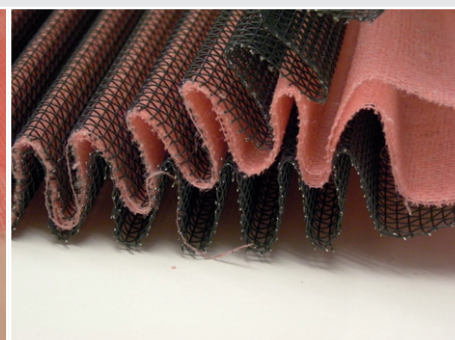

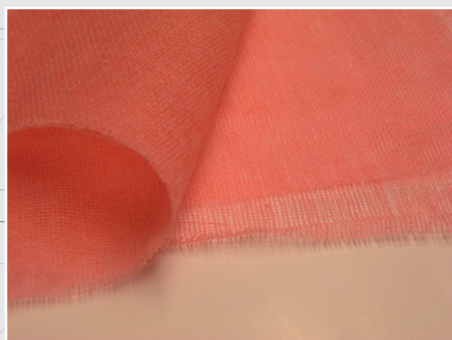

La scelta di un filtro in cotone BMC porta i seguenti vantaggi:

- **Migliore erogazione di potenza**
- **Migliori prestazioni**
- **Maggiore durabilità del motore**
- **Riduzione consumi**
- **Risparmio di denaro**

Il filtraggio delle impurità avviene mediante i processi di setacciamento e ritenzione, ossia l'intercettazione delle impurità da parte delle fibre di cotone e la loro cattura da parte dell'olio.

Questo procedimento avviene senza l'occlusione del passaggio del flusso d'aria, garantendo in questo modo stabilità nel tempo delle prestazioni del filtro aria.

I filtri aria BMC sono realizzati utilizzando un procedimento chiamato "Full Moulding" che consente di ottenere il caratteristico filtro rosso da un'unica stampata senza richiedere incollaggi negli angoli, causa di facili rotture. La particolare gomma usata nei sistemi di filtrazione BMC è praticamente indeformabile nel tempo e con ottime caratteristiche di adesione a qualsiasi forma di airbox.
